# Fundamentos de análisis y diseño de algoritmos

Ecuaciones de recurrencia

Método de iteración

Método maestro\*

Método de sustitución

#### Método de iteración

Expandir la recurrencia y expresarla como una suma de términos que dependen de n y de las condiciones iniciales

 $T(n) = n + 3T(n/4), T(1) = \Theta(1) y n par$ 

Expandir la recurrencia 2 veces

$$T(n) = n + 3T(n/4)$$

$$n + 3 (n/4 + 3T(n/16))$$

$$n + 3 (n/4 + 3(n/16 + 3T(n/64)))$$

$$n + 3*n/4 + 3^2*n/4^2 + 3^3T(n/4^3)$$

¿Cuándo se detienen las iteraciones?

$$T(n) = n + 3T(n/4)$$

$$n + 3 (n/4 + 3T(n/16))$$

$$n + 3 (n/4 + 3(n/16 + 3T(n/64)))$$

$$n + 3*n/4 + 3^2*n/4^2 + 3^3T(n/4^3)$$

¿Cuándo se detienen las iteraciones? Cuando se llega a T(1)

$$T(n) = n + 3T(n/4)$$

$$n + 3 (n/4 + 3T(n/16))$$

$$n + 3 (n/4 + 3(n/16 + 3T(n/64)))$$

$$n + 3*n/4 + 3^{2}*n/4^{2} + 3^{3}T(n/4^{3})$$

$$n + 3 (n/4 + 3(n/16 + 3T(n/64)))$$

$$n + 3*n/4 + 3^{2}*n/4^{2} + 3^{3}T(n/4^{3})$$

$$n + 3 (n/4 + 3(n/16 + 3T(n/64)))$$

$$(3 n + 3 (n/4 + 3(n/16 + 3T(n/64)))$$

$$(3 n + 3 (n/4 + 3(n/16) + 3 (n/4))$$

$$(3 n + 3 (n/4 + 3T(n/64)))$$

$$(3 n + 3 (n/4 + 3T(n/64))$$

$$(3 n + 3 (n/4 + 3T(n/64)))$$

$$(3 n + 3 (n/4 + 3T(n/64))$$

$$(3 n + 3 (n/4 + 3T(n/64)))$$

$$(3 n + 3 (n/4 + 3T(n/64))$$

$$(3 n + 3 (n/4 + 3T(n/64)))$$

$$(3 n + 3 (n/4 + 3T(n/64))$$

$$(3 n + 3 (n/4 + 3T(n/64)))$$

$$(3 n + 3 (n/4 + 3T(n/64))$$

$$(3 n + 3 (n/4 + 3T(n/64$$

$$T(n) = n + 3T(n/4)$$

$$n + 3 (n/4 + 3T(n/16))$$

$$n + 3 (n/4 + 3(n/16 + 3T(n/64)))$$

$$n + 3*n/4 + 3^2*n/4^2 + 3^3T(n/4^3)$$

$$n + 3*n/4 + 3^2*n/4^2 + 3^3n/4^3 + ... + 3^{\log 4n}T(1)$$

¿Cuándo se detienen las iteraciones?

Cuando se llega a T(1), esto es, cuando  $(n/4^i)=1$ 

$$T(n) = n + 3T(n/4)$$

$$n + 3 (n/4 + 3T(n/16))$$

$$n + 3 (n/4 + 3(n/16 + 3T(n/64)))$$

$$n + 3*n/4 + 3^2*n/4^2 + 3^3T(n/4^3)$$

$$n + 3*n/4 + 3^2*n/4^2 + 3^3n/4^3 + ... + 3^{\log 4n}T(1)$$

Después de iterar, se debe tratar de expresar como una sumatoria con forma cerrada conocida

```
T(n) = n + 3T(n/4])
n + 3 (n/4] + 3T(n/16]))
n + 3 (n/4] + 3(n/16] + 3T(n/64])))
n + 3*n/4] + 3^2*n/4^2] + 3^3(n/4^3]) + ... + 3^{\log 4n}\Theta(1)
\leq n + 3n/4 + 3^2n/4^2 + 3^3n/4^3 + ... + 3^{\log 4n}\Theta(1)
```

$$T(n) = n + 3T(n/4)$$

$$n + 3 (n/4 + 3T(n/16))$$

$$n + 3 (n/4 + 3(n/16 + 3T(n/64)))$$

$$n + 3*n/4 + 3^{2*}n/4^{2} + 3^{3}(n/4^{3}) + ... + 3^{\log 4n}\Theta(1)$$

$$\leq n + 3n/4 + 3^{2}n/4^{2} + 3^{3}n/4^{3} + ... + 3^{\log 4n}\Theta(1)$$

$$= (\sum_{i=0}^{\log_{4}n} (\frac{3}{4})^{i}n) + 3^{\log_{4}n}\Theta(1)$$

$$= n(\frac{(3/4)^{(\log_{4}n)} - 1}{(3/4) - 1}) + n^{\log_{4}3} = n*4(1 - (3/4)^{(\log_{4}n)}) + \Theta(n^{\log_{4}3})$$

$$= O(n)$$

Resuelva por el método de iteración

$$T(n) = 2T(n/2) + 1, T(1) = \Theta(1)$$

$$T(n) = 2\left(2T\left(\frac{n}{2^2}\right) + 1\right) + 1$$

$$T(n) = 2\left(2\left(2T\left(\frac{n}{2^3}\right) + 1\right) + 1\right) + 1$$

$$T(n) = 2\left(2\left(2T\left(\frac{n}{2^3}\right) + 1\right) + 1\right) + 1$$

$$T(n) = 2^{i} T\left(\frac{2}{2^{q}}\right) + 2^{3} + 2^{2} + 2 + 2^{3}$$

$$T(n) = 2^{i} T\left(\frac{n}{2^{i}}\right) + 2^{i-1} + 2^{i-2} + \dots + 2^{2} + 2^{i} + 2^{i} + 2^{i}$$

$$T(1) \qquad 1 = \frac{n}{2^{i}} \qquad i = \log_{2}(n) \qquad \sqrt{\log(n)} \qquad \sqrt{\log(n)} \qquad 2^{\log_{2}(n)} \qquad \sqrt{\log(n)} \qquad 2^{\log_{2}(n)} \qquad \sqrt{\log(n)} \qquad 2^{\log_{2}(n)} \qquad 2$$

Resuelva por el método de iteración

$$T(n) = 2T(n/2) + 1$$
,  $T(1) = \Theta(1)$ 

$$T(n) = 2T(n/2) + n, T(1) = \Theta(1)$$

$$T(n) = 2 \frac{\log_{2}(n)}{1 + 2 \log_{2}(n) - 1} + 2 \frac{\log_{2}(n) - 2}{1 + 2 \log_{2}(n) - 2} + 2 \frac{1}{1 + 2}$$

$$T(n) = n T(1) + 2 \frac{\log_{2}(n) - 1}{1 + 2 \log_{2}(n) - 1}$$

$$T(n) = n \Theta(1) + 2 \frac{\log_{2}(n) - 1 + 1}{2 - 1}$$

$$T(n) = n \Theta(2) + n - 1 \longrightarrow \Theta(1)$$

$$T(n) = 2 + \frac{1}{(2-1)} + \frac{1$$

$$\frac{2^{i} + (\frac{n}{2^{i}}) + in}{2^{i} + og_{2}(n)} = \frac{1}{2^{i}} = \frac{1}{$$

$$T(n) = 2 \overline{1(\frac{n}{2})} + n^{2} \qquad \Theta(1) = \overline{1(\frac{n}{2})}$$

$$1) \qquad T(n) = 2 \left(2 \overline{1(\frac{n}{2})} + (\frac{n}{2})^{2} + n^{2} + n^$$

$$T(n) = n T(1) + \frac{\log_2(n)}{2!} + \frac{2}{2!} \left(\frac{n}{2!}\right)^2$$

$$T(n) = n O(1) + \frac{\log_2(n)}{2!} + \frac{2}{2!} \left(\frac{n}{2!}\right)^2$$

$$T(n) = n O(2) + \frac{\log_2(n)}{2!} + \frac{2}{2!} \left(\frac{n}{2!}\right)^2$$

$$T(n) = n O(2) + \frac{\log_2(n)}{2!} + \frac{2}{2!} \left(\frac{n}{2!}\right)^2$$

$$T(n) = n \theta(1) + n^{2} \left( \frac{1}{2} \log n^{2} \right)$$

$$T(n) = n \theta(1) + n^{2} \left( \frac{1}{2} \log (0.5) - 1 \right)$$

$$T(n) = n \theta(1) + n^{2} \left( -2 \left( n^{2} - 1 \right) \right)$$

$$T(n) = n \theta(1) - 2n + 2n^{2}$$

$$\left( \frac{1}{2} \log n^{2} \right)$$

Resuelva por el método de iteración

$$T(n) = 2T(n/2) + 1$$
,  $T(1) = \Theta(1)$ 

$$T(n) = 2T(n/2) + n, T(1) = \Theta(1)$$

$$T(n) = T(n/2) + 1$$
,  $T(1) = \Theta(1)$ 

$$T(0) = 4T(\frac{0}{3}) + 0 + 1$$
 $T(1) = 1$ 

Resuelva por el método de iteración

$$T(n) = 2T(n/2) + 1$$
,  $T(1) = \Theta(1)$ 

$$T(n) = 2T(n/2) + n, T(1) = \Theta(1)$$

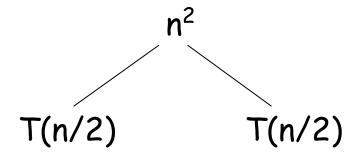

$$T(n) = T(n/2) + 1$$
,  $T(1) = \Theta(1)$ 

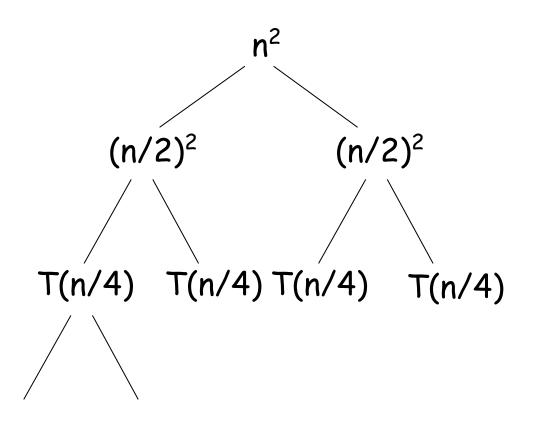

Demuestre que T(n) = T(n/2] + n, es  $\Omega(n \log n)$ 

Iteración con árboles de recursión

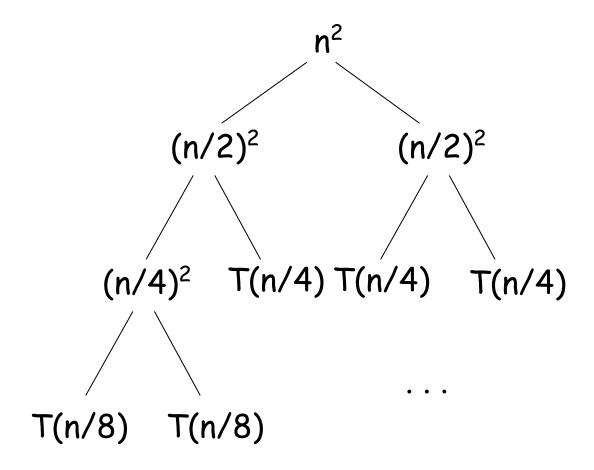

$$T(1) = 1$$

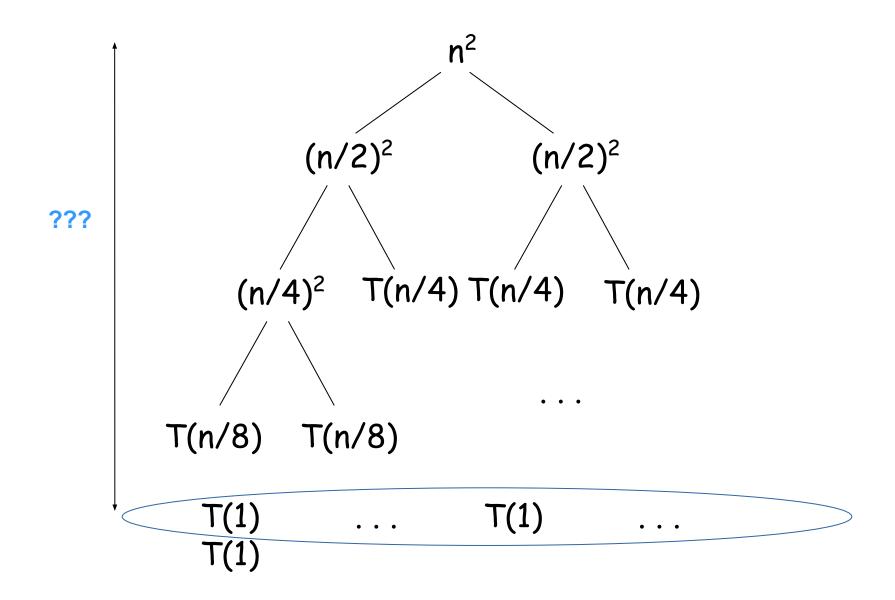

$$T(n) = 2T(n/2) + n^2$$

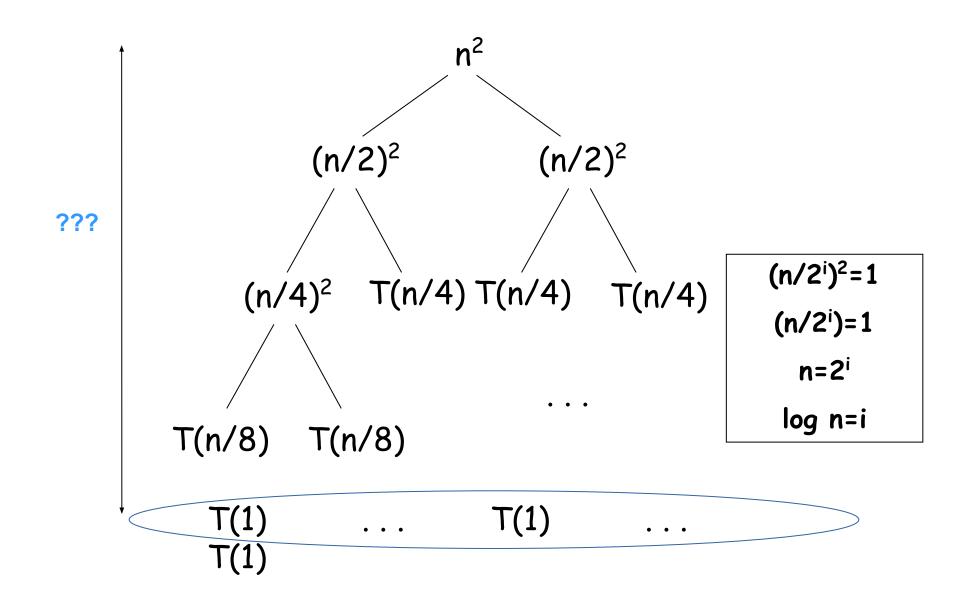

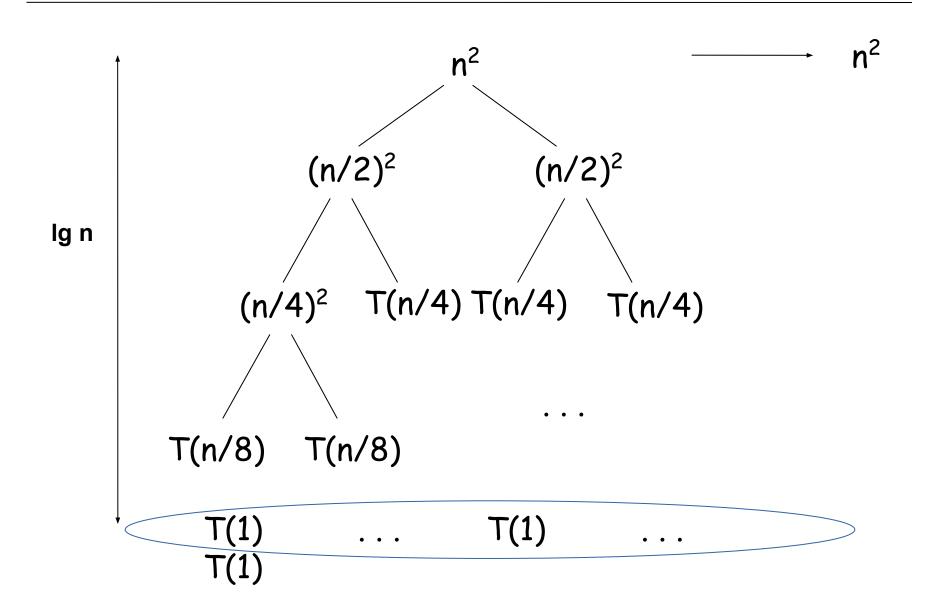

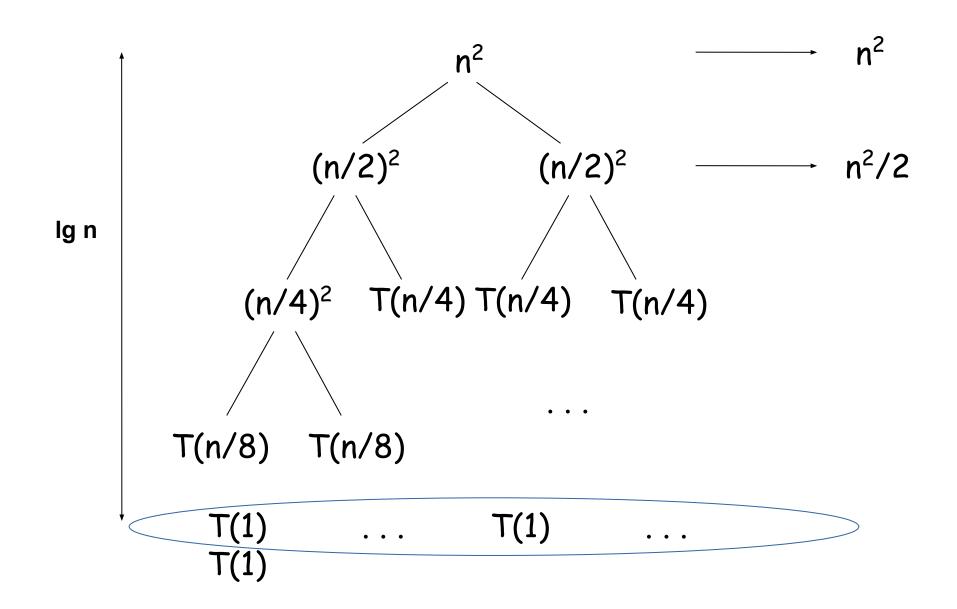

. . .

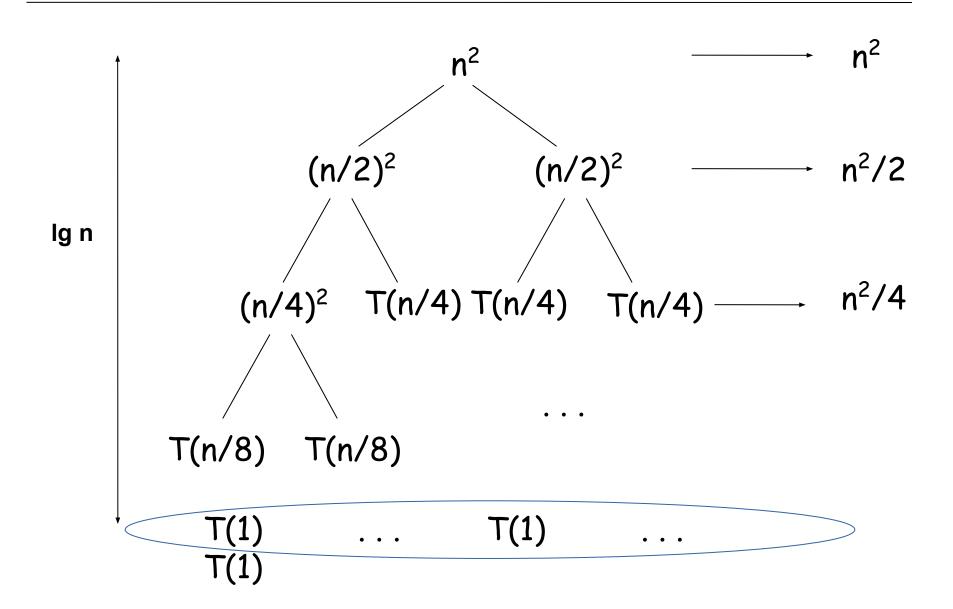

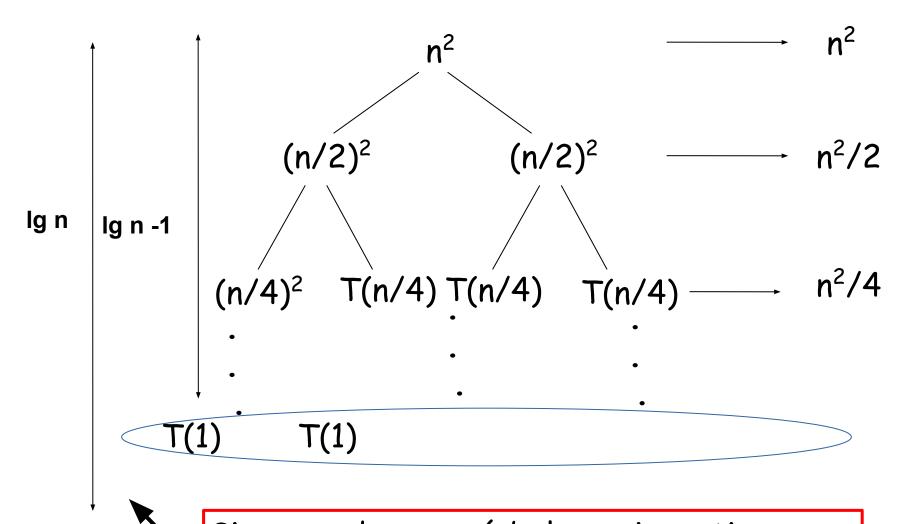

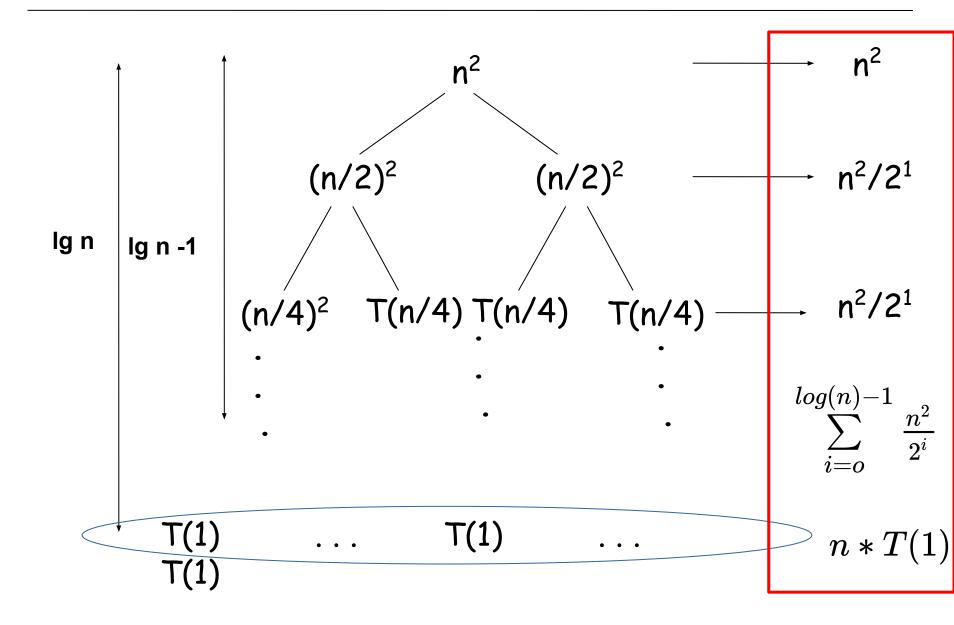

Si recuerda en un árbol m-ario se tienen máximo m<sup>h</sup>. En este caso al ser arbol binario m=2, tenemos 2<sup>log(n)</sup> hojas. Por lo tanto se

$$T(n) = n*T(1) + \sum_{i=o}^{log(n)-1} rac{n^2}{2^i}$$

$$T(n) = n*c + n^2 rac{0.5^{log(n)} - 1}{0.5 - 1}$$

$$T(n) = n*c + n^2 rac{n^{log(0.5)} - 1}{-0.5}$$

$$T(n) = n*c + n^2 rac{n^{-1}-1}{-0.5}$$

$$T(n) = n * c - \frac{n}{0.5} + \frac{n^2}{0.5} = O(n^2)$$

Resuelva construyendo el árbol

$$T(n) = 2T(n/2) + 1$$
,  $T(1) = \Theta(1)$ 

$$T(n) = 2T(n/2) + n, T(1) = \Theta(1)$$

Resuelva la recurrencia T(n) = T(n/3) + T(2n/3) + n

Indique una cota superior y una inferior

#### Método maestro

Permite resolver recurrencias de la forma:

$$T(n) = aT(n/b) + f(n)$$
, donde  $a \ge 1$ ,  $b > 1$ 

Dado T(n) = aT(n/b) + f(n), donde  $a \ge 1$ , b > 1, se puede acotar asintóticamente como sigue:

1. 
$$T(n) = \Theta(n^{\log_b a})$$
  
Si  $f(n) = O(n^{\log_b a - \varepsilon})$  para algún  $\varepsilon > 0$ 

2. 
$$T(n) = \Theta(n^{\log_b a} \lg n)$$
  
Si  $f(n) = \Theta(n^{\log_b a})$  para algún  $\varepsilon > 0$ 

3. 
$$T(n) = \Theta(f(n))$$
  
Si  $f(n) = \Omega(n^{\log_b a + \varepsilon})$  para algén>0 si a\*f(n/b)  
 $\leq c*f(n)$ 

para alaun c<1

Dado 
$$T(n) = 9T(n/3) + n$$

$$n^{\log_3 9} = n^2$$
 Vs  $f(n) = n$ 

Es 
$$f(n)=O(n^{\log_b a-\epsilon})$$
 ?  
Es  $n=O(n^{2-\epsilon})$  ?

Dado 
$$T(n) = 9T(n/3) + n$$

$$n^{\log_3 9} = n^2 \mathbf{v_s} \qquad f(n) = n$$

Es 
$$f(n)=O(n^{\log_b a-\epsilon})$$
 ?  
Es  $n=O(n^{2-\epsilon})$  ?  
Si  $\epsilon=1$  se cumple que  $O(n)$  , por lo tanto, se cumple que:

$$T(n) = \Theta(n^2)$$

$$T(n) = T(2n/3) + 1$$

$$n^{\log_{3/2} 1} = n^0 = 1$$
  $v_s$   $f(n) = 1$ 

Es 
$$f(n)=O(n^{\log_b a-\varepsilon})$$
 ?  
Es  $1=O(n^{0-\varepsilon})$  ?

No existe  $\varepsilon > 0$ 

$$T(n) = T(2n/3) + 1$$

$$n^{\log_{3/2} 1} = n^0 = 1$$
 vs  $f(n) = 1$ 

Es 
$$f(n) = \Theta(n^{\log_b a})$$
 ?  
Es  $1 = \Theta(1)$  ?

Si, por lo tanto, se cumple que:

$$T(n) = \Theta(1*\lg n) = \Theta(\lg n)$$

$$T(n) = 3 T(n/4) + nlgn$$

$$n^{\log_4 3} = n^{0.793} \quad \text{vs} \quad f(n) = n | \text{Ign}$$
Es  $f(n) = O(n^{\log_b a - \varepsilon})$ ?
Es  $f(n) = \Theta(n^{\log_b a})$ ?
Es  $f(n) = \Theta(n^{\log_b a})$ ?
Si, y además, af(n/b) \le cf(n)
$$3(n/4) | \text{Ign} - 3(n/4)^* 2 \leq \text{cnlgn}$$

$$(3/4) n | \text{Ign} \leq \text{cnlgn} \rightarrow c = 3/4 \text{ y se concluye } \P(q) = \Theta(n | \text{Ign})$$

T(n) = 2T(n/2) + nlgn

Muestre que no se puede resolver por el método maestro

#### Resuelva usando método del maestro

$$T(n) = 4T(n/2) + n$$

$$T(n) = 4T(n/2) + n^2$$

$$T(n) = 4T(n/2) + n^3$$

#### Método de sustitución

Suponer la forma de la solución y probar por inducción matemática

$$T(n)=2T(Ln/2])+n, T(1)=1$$

Suponer que la solución es de la forma T(n)=O(nlgn)

Probar que T(n)≤cnlgn.

Se supone que se cumple para n/2 y se prueba para n

Hipotesis inductiva:  $T(n/2) \le cn/2lg(n/2)$ 

$$T(n)=2T(Ln/2])+n, T(1)=1$$

Probar que T(n)≤cnlgn.

Hipótesis inductiva:  $T(n/2) \le cn/2lg(n/2)$ 

#### Paso inductivo:

```
T(n) \le 2(cn/2lg (n/2)) + n

\le cn lg (n/2) + n

= cn lg (n) - cn + n, para c \ge 1, haga c = 1

\le cn lg n
```

$$T(n)=2T(Ln/2])+n, T(1)=1$$

Probar que T(n)≤cnlgn.

Paso base: si c=1, probar que T(1)=1 se cumple

$$T(1) \le 1*1 lg 1?$$
  
1 \le 0?

No, se debe escoger otro valor para c

$$T(n)=2T(Ln/2])+n, T(1)=1$$

Probar que T(n)≤cnlgn.

Paso base: si c=2, probar que T(1)=1 se cumple

$$T(1) \le 2*1 lg 1?$$
  
1 \le 0?

No, se puede variar k.

Para esto, se calcula T(2) y se toma como valor inicial

Probar que T(n)≤cnlgn.

$$T(2)=2T(0)+2=4$$

Paso base: si c=1, probar que T(2)=4 se cumple

$$T(2) \le 1*2lg 2 ?$$

$$4 \leq 2$$
?

No, se puede variar c.

Probar que T(n)≤cnlgn.

$$T(2)=2T(0)+2=4$$

Paso base: si c=3, probar que T(2)=4 se cumple

$$T(2) \le 3*2lg 2 ?$$

Si, se termina la demostración

$$T(n)=T(n-1)+T(n-2)+1$$
,  $T(1)=O(1)$ ,  $T(2)=O(1)$ 

Suponer que la solución es de la forma  $T(n)=O(2^n)$ 

Probar que  $T(n) \le c2^n$ .

Se supone que se cumple para n-1 y se n-2 prueba para n

Hipotesis inductiva:  $T(n-1) \le c2^{(n-1)}$  y  $T(n-2) \le c2^{(n-2)}$ 

$$T(n)=T(n-1)+T(n-2)+1$$
,  $T(1)=O(1)$ ,  $T(2)=O(1)$ 

Ahora se debe probar que:  $T(n) \le c2^n$ 

$$T(1) \le c2^1 \rightarrow 1 \le 2*c$$

$$T(2) \le c2^2 \rightarrow 1 \le 4*c$$

$$T(3) \le c2^3 \rightarrow 2 \le 8*c$$

$$T(4) \le c2^4 \rightarrow 3 \le 16*c$$

$$T(5) \le c2^5 \rightarrow 5 \le 32*c$$

$$T(6) \le c2^6 \to 8 \le 64*c$$

$$T(7) \le c2^7 \rightarrow 13 \le 128*c$$

$$T(8) \le c2^8 \rightarrow 21 \le 256 * c$$

Con c = 1, se cumple.
